BOT CHAIN · CHAINID 677 · LIVE ON MAINNET

Stamp it, and it exists.

ProofOfAI is a content-authenticity registry. Hash any file or text in the browser — only the keccak256 is written on-chain, timestamped to your wallet forever.

app-6laz.vercel.app github.com/DruxAMB/ProofOfAi

THE PROBLEM

A creator posts work; weeks later a dispute over who made it first can't be settled by file metadata — it can be edited freely. A public timestamp anchored to a wallet settles it, but only if the timestamp can't be forged *and the content never has to be uploaded anywhere.*

WHAT PROOFOFAI IS

Browser-side hashing. keccak256 runs client-side — the file never leaves the machine. Only the 32-byte digest touches the chain; privacy by construction.

One content, one record. Re-notarizing an identical hash reverts (`already notarized`) — duplicates can't rewrite history.

Anyone can verify. Paste a hash; get back `exists, author, timestamp, kind` — a free read call, no wallet needed.

Permanently addressed. UUPS + ERC1967 proxy: the implementation can be upgraded while the address consumers verify against never changes.

ARCHITECTURE

Notarization is a signed transaction (`notarize` with kind: text / image / other); verification is a free call (`verify`, `totalNotarized`). Upgrade authority sits with the project owner wallet only.

STATUS & TRACTION

Item	State
Contract	Deployed on BOT Chain mainnet — proxy `0xf201…CEfF`, verified on scan.botchain.ai
Frontend	Live — app-6laz.vercel.app (notarize, verify, wallet connect)
Code	Open source — github.com/DruxAMB/ProofOfAi (MIT)
Stage	Mainnet live; registry open for first attestations

WHY IT FITS BOT CHAIN

- **Native utility, not a wrapper** — provenance is infrastructure every AI-content tool on the chain can call without permission.
- **Real transaction surface** — every attestation is a user-paid mainnet transaction with a durable on-chain artifact.

- **Privacy-preserving by design** — hash-only storage proves existence without exposing content; no custodial upload anywhere.
- **Composable** — any contract can call `verify` on-chain; tipping, badges and oracle consumers can gate on attestation.

ROADMAP

- Attestation feed UI (recent notarizations) beyond hash-only lookup.
- Batch notarization — one tx, many hashes, for publishing pipelines.
- Signed-metadata attestations linking hashes to AgentID registry entries.
- Verify-as-middleware snippets other BOT Chain dApps can drop in.
